

Project Design Phase-II

Data Flow Diagram & User Stories

Date	03 October 2026
Team ID	6aba0fe75015c35b98630d90
Project Name	Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer
Maximum Marks	4 Marks

Data Flow Diagrams:

A Data Flow Diagram (DFD) is a traditional visual representation of the information flows within a system. For this solution, the DFD shows how an employee request for a standard laptop enters the procurement workflow, how Flow Designer validates and routes the request, and how fulfillment and status information are stored.

DFD Level 0 – Standard Laptop Order Automation

Employee	→	Service Catalog	→	Laptop Request
Laptop Request	→	Flow Designer	→	Validation & Approval
Approval Result	→	Procurement / Asset System	→	Standard Laptop Order
Order	→	Vendor / Fulfillment	→	Shipment & Asset Update
Status / Outcome	←	Flow Designer	←	Employee Notification

Key data flows:

- Employee details and laptop request information are submitted through the service catalog.
- Flow Designer validates that the request matches the approved standard laptop configuration.
- Eligible requests follow the configured approval path; exceptions are routed for manual review.
- Approved requests create or update procurement and asset records and trigger fulfillment activities.
- Order status and completion information are returned to the employee through notifications.

User Stories

Use the below template to list all the user stories for the product. The following stories cover the standard laptop ordering journey from request submission through fulfillment.

User Type	Functional Requirement(Epic)	User StoryNumber	User Story / Task	Acceptance criteria	Priority	Release
Employee	Laptop Request	USN-1	As an employee, I can submit a standard laptop request through the service catalog.	Required requester, delivery and laptop details are captured and a request record is created.	High	Sprint-1
Employee	Laptop Request	USN-2	As an employee, I can view the status of my laptop request.	The request shows its current stage, such as submitted, awaiting approval, ordered, fulfillment or completed.	High	Sprint-1
Flow Designer	Validation	USN-3	As the system, I can automatically validate that the requested laptop matches the approved standard configuration.	Valid standard requests proceed automatically; non-standard selections are routed to exception handling.	High	Sprint-1
Approver	Approval	USN-4	As an approver, I can review and approve or reject an eligible laptop request.	The approver receives the request details and the decision updates the workflow.	High	Sprint-1
Flow Designer	Procurement	USN-5	As the system, I can create the required procurement task/order after approval.	An approved request creates the appropriate procurement record without duplicate order creation.	High	Sprint-2
Procurement Team	Order Management	USN-6	As a procurement team member, I can view the laptop order and its associated employee request.	The procurement record is traceable to requester, item, quantity and fulfillment information.	Medium	Sprint-2
Asset Manager	Asset Management	USN-7	As an asset manager, I can update the asset record when the laptop is received and assigned.	The asset has the required status, ownership and assignment details.	Medium	Sprint-2
Employee	Notifications	USN-8	As an employee, I receive notifications when my laptop request changes status.	Notifications are sent for approval outcome, order placement, fulfillment and completion.	Medium	Sprint-2
Administrator	Exception Handling	USN-9	As an administrator, I can define routing for	Exceptions are assigned to the correct team and	Medium	Sprint-2

			non-standard or incomplete requests.	include the reason for manual review.		
Administrator	Automation Monitoring	USN-10	As an administrator, I can monitor Flow Designer executions and failed steps.	Failed flows are identifiable with actionable status information so the request can be investigated.	Low	Sprint-3

Scope note: This document focuses on the standard laptop ordering path and its automation/data flows. Specific ServiceNow tables, catalog variables, approval policies, integrations and vendor interfaces should be configured according to the organization's implementation requirements.
