

Project Design Phase

Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

Date	03 October 2026
Team ID	6aba0fe75015c35b98630d90
Project Name	Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer
Maximum Marks	2 Marks

Proposed Solution

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Standard laptop procurement often relies on manual request reviews, email follow-ups, approval routing, and status updates. These steps can create delays, inconsistent checks, duplicate data entry, and limited visibility for employees and IT teams. The project addresses the need for a consistent, traceable process for ordering pre-approved standard laptops.
2	Idea / Solution description	Implement a ServiceNow Flow Designer workflow for standard laptop orders. An employee submits a catalog request and provides required details such as user, department, location, and business justification. The flow validates mandatory fields and eligibility, routes the request to the appropriate manager or cost-center approver, and then creates or updates fulfillment tasks for IT procurement and asset teams after approval. Notifications communicate submission, approval, fulfillment, and completion status. Rejections or incomplete requests are returned with a clear reason, while exceptions are routed for manual review.

3	Novelty / Uniqueness	The solution uses a low-code, event-driven workflow to connect request intake, policy checks, approvals, fulfillment, and communications in one auditable process. Reusable flow components, decision logic, and standardized request data reduce reliance on ad hoc emails. The design also distinguishes routine orders from exceptions, allowing standard requests to follow a predictable path without removing human oversight where judgment is required.
4	Social Impact / Customer Satisfaction	Employees gain a simpler, trackable way to request required equipment and receive timely updates. Clear approval steps and consistent eligibility checks can improve fairness and reduce uncertainty. IT and procurement staff spend less time on repetitive coordination and more time on support and exception handling. Access controls, data minimization, and an audit trail help protect employee and purchasing information.
5	Business Model (Revenue Model)	This is an internal operational-efficiency solution rather than a direct revenue-generating product. Expected value comes from reduced administrative effort, fewer incomplete or duplicate requests, improved policy compliance, and better visibility into procurement demand. Benefits can be assessed by comparing processing time, manual touchpoints, rework rates, and fulfillment performance before and after implementation. Any ServiceNow licensing, integration, and maintenance costs should be evaluated against these savings.
6	Scalability of the Solution	The workflow can be extended to additional laptop models, employee groups, locations, and approval policies through configurable catalog variables, decision tables, and reusable subflows. Integration with inventory, purchasing, and asset-management systems can provide stock checks and fulfillment updates. The process should be piloted with one standard device category, monitored using defined service metrics, and expanded after validating controls, exception

		handling, and performance.
